

# *Calibration of Barometers*

(Theory and Practice )

Japan Meteorological Agency

Feb. 21, 2013

**JMA/WMO Training Workshop on Calibration and Maintenance of Meteorological Instruments in RA II**

# Contents

## § 1 Calibration of barometers (theory)

- 1) Traceability of pressure
- 2) Principles of barometers
  - a. mercury barometer
  - b. aneroid barometer & aneroid barograph
  - c. electronic barometer
  - d. air piston gauge
- 3) Calibration
  - a. mercury barometer
  - b. aneroid barometer & aneroid barograph
  - c. electronic barometer

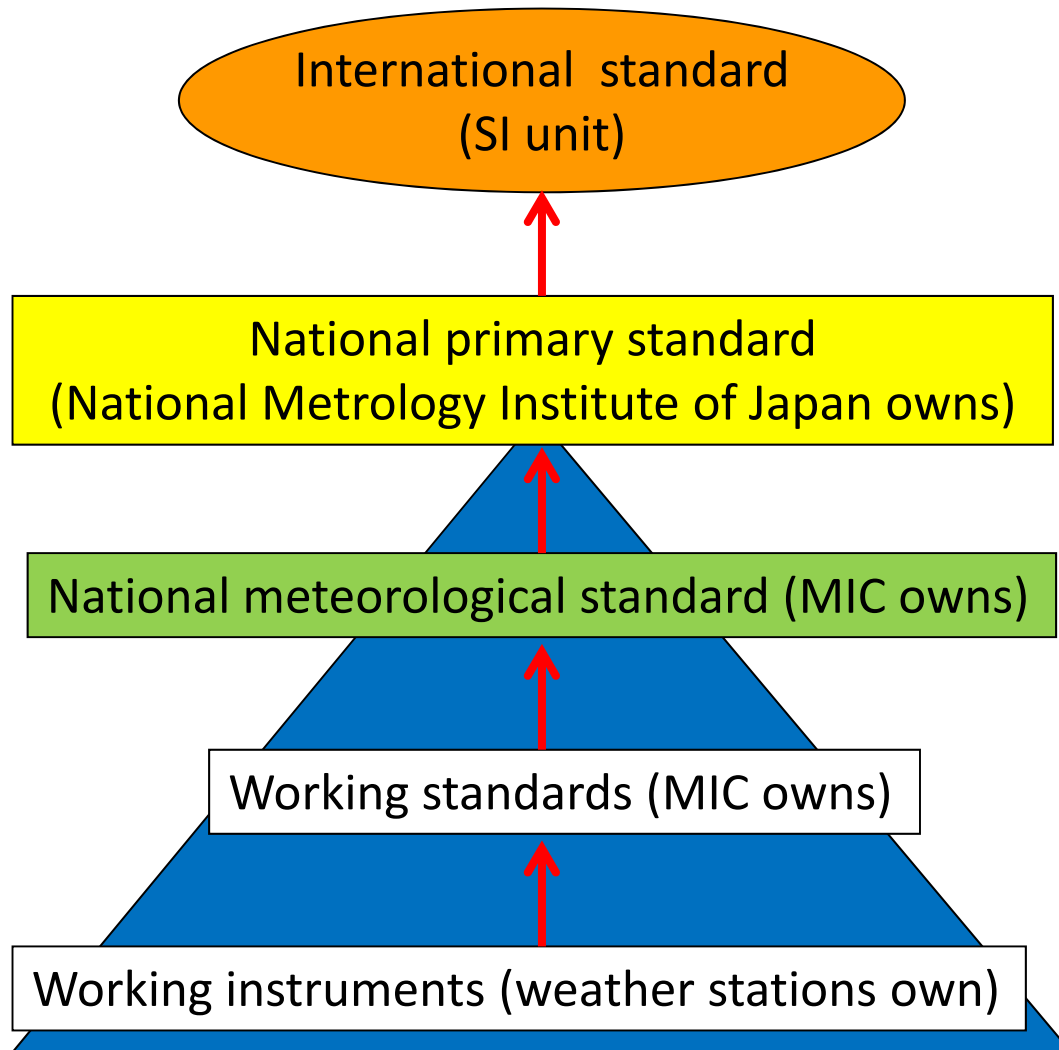

## § 2 Calibration of barometers (practice)

- 1) explanation of today's practice
- 2) practice calibrating barometers in the calibration rooms

# § 1 Calibration of barometers (theory)

JMA/WMO Training Workshop on  
Calibration and Maintenance of  
Meteorological Instruments in RA II

# 1) Traceability of pressure (JMA's traceability)

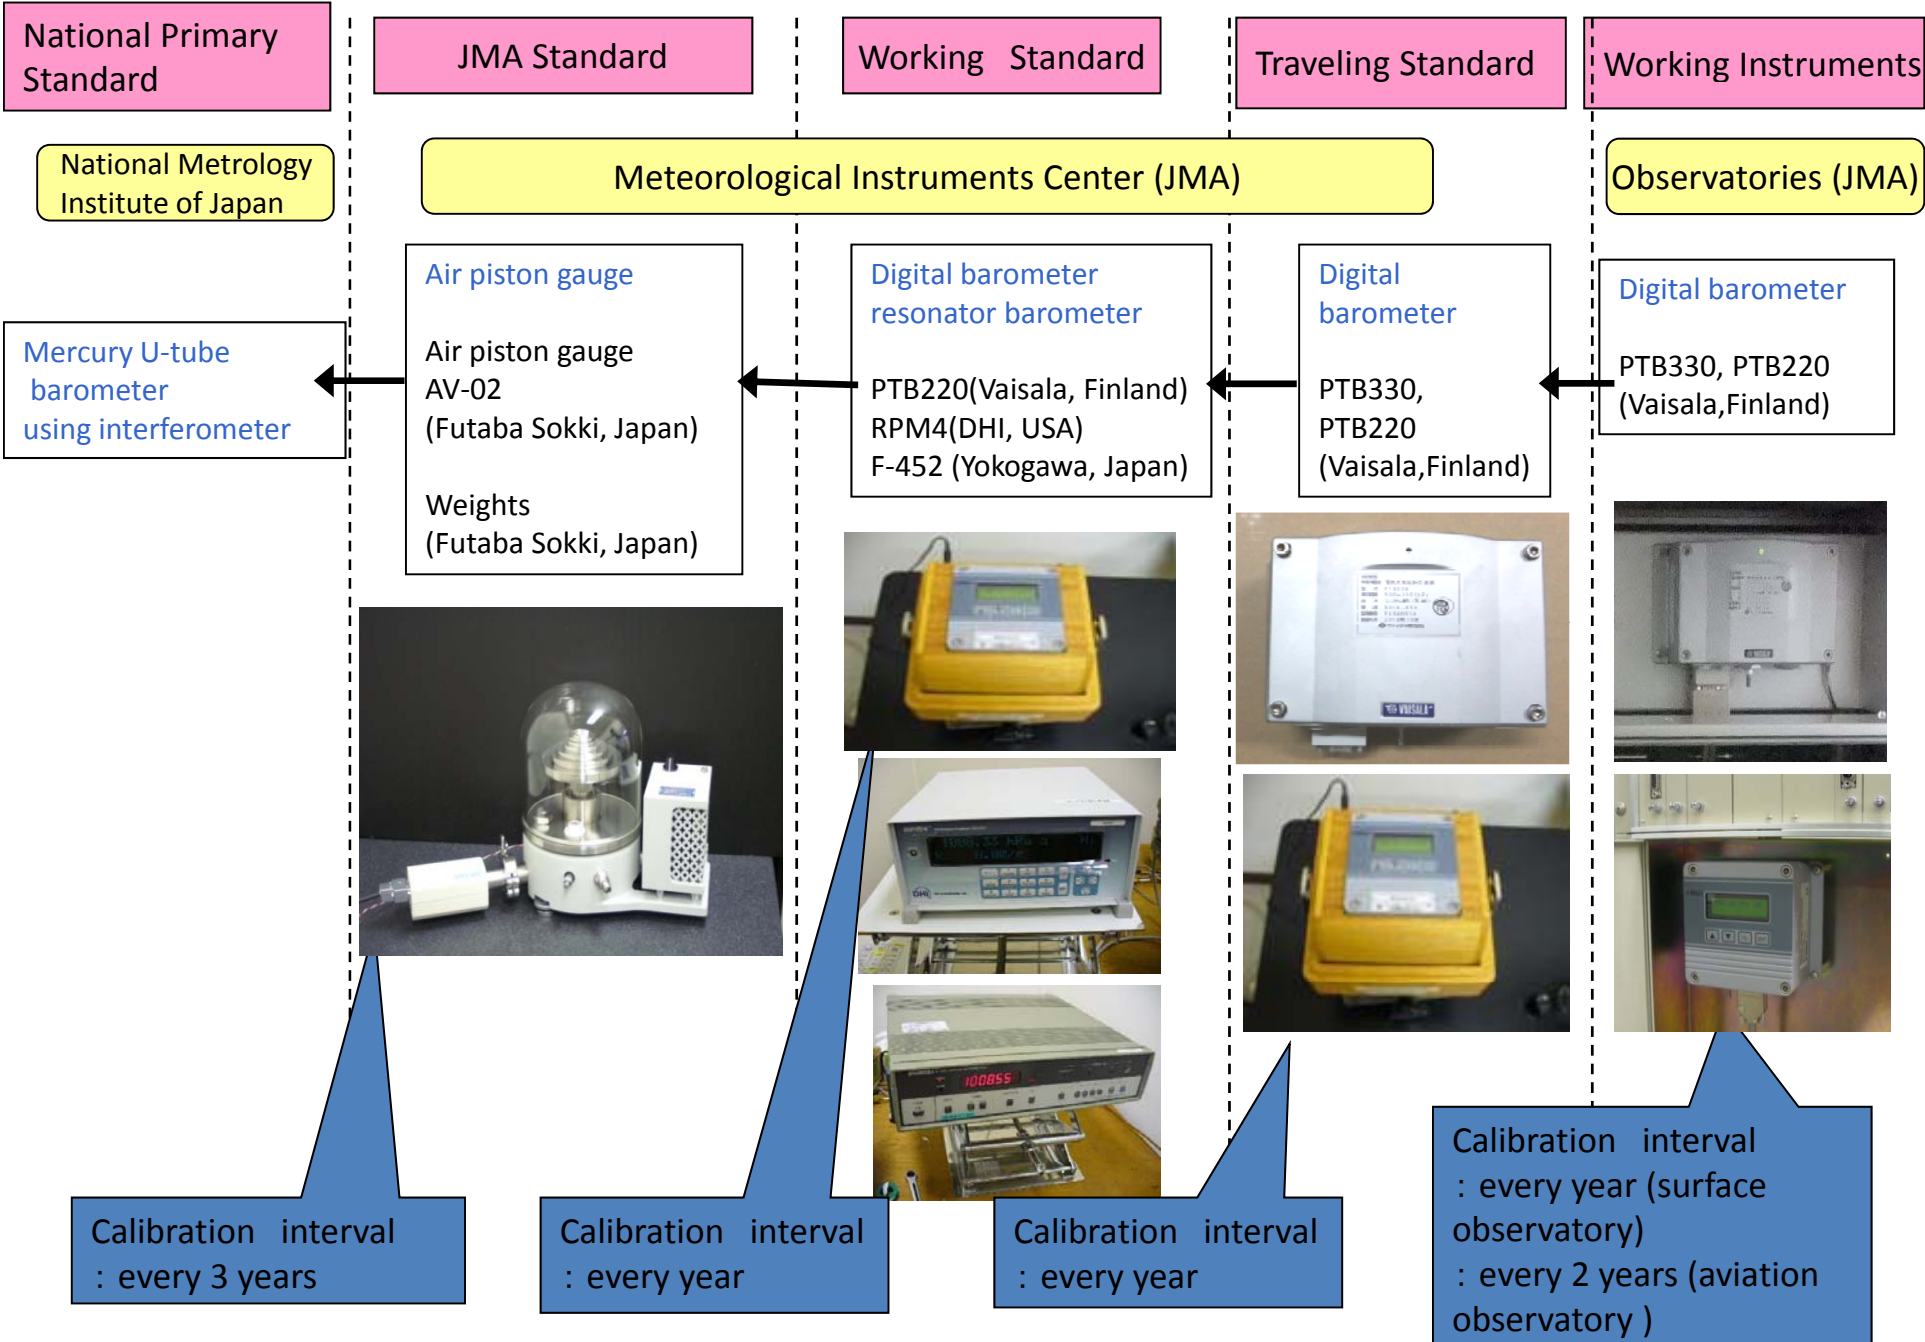

metrological traceability is defined by VIM ※ as "property of a measurement result whereby the result can be related to a reference through a documented unbroken chain of calibrations, each contributing to the measurement uncertainty"

※ International vocabulary of metrology - Basic and general concepts and associated terms(VIM), (ISO/IEC Guide 99:2007)

Calibration interval : every 3 years

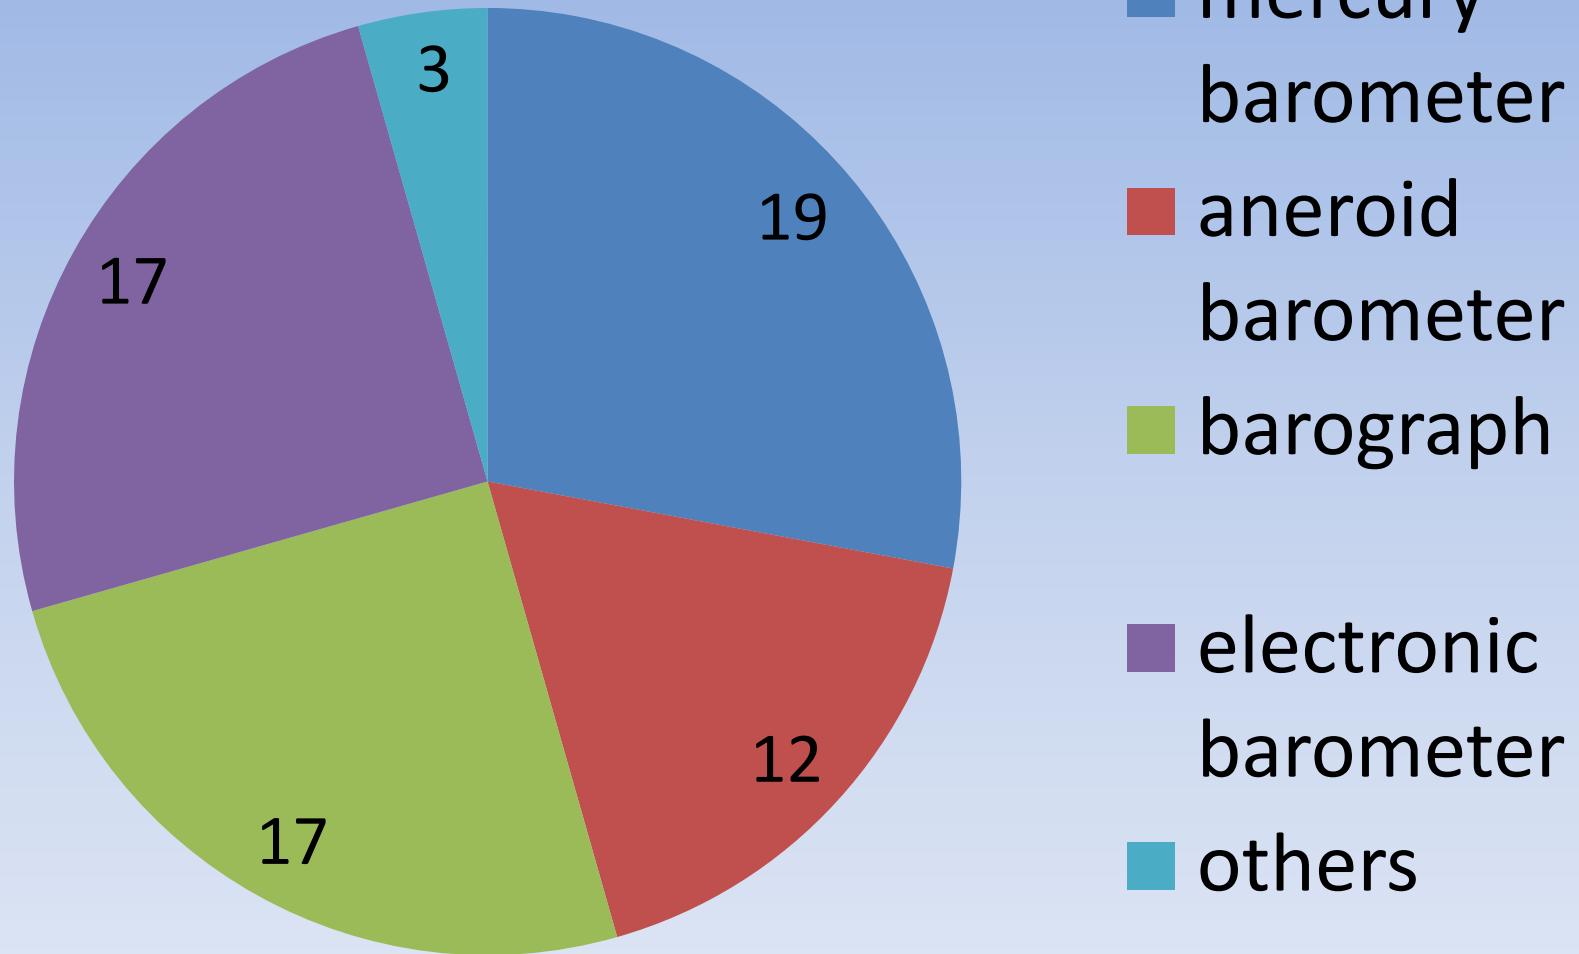

Calibration interval : every year

Calibration interval : every year

Calibration interval : every year (surface observatory)  
 : every 2 years (aviation observatory)

# Replies to the questionnaire\* on barometers

What kind of barometers are you using for observations ?

\* 24 countries of RA II replied in 2011, multiple answers allowed

## 2) a. Mercury barometer

### principle

atmospheric pressure is balanced against the weight of a column of mercury. For normal meteorological purposes, the length of the mercury column is measured against a scale graduated in units of pressure.

### characteristics

- very delicate and difficult to transport;
- it is difficult to maintain the instrument and to clean the mercury;
- the instrument must be read and corrections applied manually;
- mercury vapor is highly toxic; → there is an increasing move away from the use of mercury barometers ;

Fig.2 principle of mercury barometer

# Mercury barometer (parts)

Fig.3 mercury barometer

## 2)b. Aneroid barometer

### Characteristics

- compactness and portability
- easier to handle and use
- lower accuracy than mercury barometers

Fig.4 aneroid barometer

# Principle (mechanism of aneroid barometer)

Fig.5 barometer capsule

Fig.6 mechanism of aneroid barometer

Fig.7 aneroid barometer

# Barograph (aneroid)

## principle

The principle of the aneroid barograph is similar to that of the aneroid barometer, except that a recording pen is used instead of an index needle.

Fig.12 aneroid barograph

Fig.13 structure of aneroid barograph

(1) Barometer capsule (2) Reed (3) Lever (4) Recording pen (5) Clock-driven drum (6) Bimetallic compensator (7) Indicator adjusting knob (8) Pen arm (9) Pin with ring (10) Holding screw of the clock-driven drum (11) Gate suspension arm.

## 2) c. Electronic barometer

### principle

Most barometers make use of transducers which transform the sensor response into a pressure-related electrical quantity in the form of either analogue signals or digital signals. Monitors and data-acquisition systems, such as those used in automatic weather stations, are frequently used to display digital outputs or digitized analogue outputs.

Fig.8 electronic barometer

**Fig.9 mechanism of electronic barometer's sensor**

$$Capacity = \epsilon_0 \frac{S}{d}$$

$S$  = area of electrode

$d$  = distance between electrodes

$\epsilon_0$  = dielectric constant of vacuum

① atmospheric pressure increases

③ capacity increases

Fig.10 mechanism of electronic barometer's sensor

## Sensors measuring pressures

Fig.12 one-sensor type

Fig.13 three-sensor type

## 2) d. Air piston gauge

WMO-CIMO requires 0.1 hPa as the desirable accuracy of field barometers, and  $\pm 0.3$  hPa in the practical operation.

Thus, standard instruments are required to be more accurate. This air piston gauge satisfies these requirements.

Fig.14 air piston gauge

(front view & top view)

# Air piston gauge

high-accuracy weights

glass case

ram axis

barometer for monitor

manual pressure adjuster

ram cylinder

vacuum pump

constant-pressure section

Fig.16 principle of air piston gauge

## Principle

The air piston gauge produces an accurate pressure by balancing the vacuum section (the upper part) and the constant-pressure section (the lower part).

Pressure in the lower part is determined by placing an approved high-accuracy weight on the upper part.

# Calibration 1 (mercury barometer)

## Conditions for calibration

- pressure change of 1 hPa/h or less
- wind velocity of 3 m/s or less

## Important points

- 20 atmospheric pressure readings should be taken.
- numbers of readings of atmospheric pressure showing a tendency of increase and a tendency of decrease should be approximately identical.
- the same person must take all measurements to prevent reading errors.
- temperature correction and gravity correction must be applied to mercury barometer readings.

Fig.17 installing barometers

match the height of the sensor inside the electronic barometer with that of the Ivory pointer

# Calibration 2 (aneroid barometer)

## Important points

- If aneroid barometer readings differ from those of the standard electrical barometer by  $\pm 0.3$  hPa or more, the index knob should be adjusted.
- pressure sensors inside both barometers must be at the same height.

# Calibration 3 (electronic barometer)

## Important points

- barometers must be connected with a pipe.
- a manual pressure adjuster must be used for setting.
- the pressure sensors inside both barometers must be at the same height.
- installation should be completed a day before calibration to allow the instruments to acclimatize to room temperature.

## § 2 Calibration of barometers (practice)

JMA/WMO Training Workshop on  
Calibration and Maintenance of  
Meteorological Instruments in RA II

# 1) today's practice

Purpose: Learn how to calibrate barometers.

Target : Being able to calibrate barometers with a traveling standard barometer in your country.

Outline ※:

- ① Calibrating a mercury barometer with a traveling standard barometer
- ② Calibrating an electronic barometer with a traveling standard barometer and a manual pressure adjuster
- ③ Calibrating an aneroid barometer with a traveling standard barometer in the chamber for pressure
- ④ Inspecting temperature effects of an aneroid barometer in a chamber for temperature

※ **①&② are set to be carried out in the barometer inspection room on the basement floor, ③&④ in the inspection room on the first floor.**

# 1. Calibrate a mercury barometer with a traveling standard barometer

traveling standard barometer

ivory point

mercury barometer

## 2. Calibrate an electronic barometer with a traveling standard barometer with a manual pressure adjuster

manual pressure adjuster  
(50 ~ 5,000 hPa)

make sure there are no leaks.

traveling standard  
barometer

barometer to be  
calibrated

match the height of the sensors  
inside the barometers

### 3. Calibrate an aneroid barometer with a traveling standard barometer in the chamber for pressure

chamber for pressure  
(4 ~ 1150hPa)

old fashioned type (not used today)

#### 4. Inspect temperature effects of an aneroid barometer in a chamber for temperature with a traveling standard barometer

aneroid barometer

traveling standard barometer

chamber for temperature
